

PRODUCT INFORMATION

GARDASIL[®]

[Quadrivalent Human Papillomavirus (Types 6, 11, 16, 18) Recombinant vaccine]

DESCRIPTION

GARDASIL[®] is a recombinant, quadrivalent vaccine.

The quadrivalent Human Papillomavirus Virus-Like Particle vaccine (HPV VLP vaccine) is a sterile liquid suspension prepared from the highly purified virus-like particles (VLPs) of the recombinant major capsid (L1) protein of HPV Types 6, 11, 16, and 18. The L1 proteins are produced by separate fermentations in recombinant yeast *Saccharomyces cerevisiae* CANADE 3C-5 (Strain 1895) and self-assembled into VLPs. The VLPs for each type are purified and adsorbed on aluminium-containing adjuvant (amorphous aluminium hydroxyphosphate sulfate, or AAHS). The quadrivalent HPV VLP vaccine is prepared by combining the adsorbed VLPs of each HPV type, the aluminium-containing adjuvant formulation, and a buffer.

GARDASIL is a sterile preparation for intramuscular administration. Each 0.5-mL dose contains approximately 20 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 40 mcg of HPV 16 L1 protein, and 20 mcg of HPV 18 L1 protein.

Each 0.5-mL dose of the vaccine contains approximately 225 mcg of aluminium (as amorphous aluminium hydroxyphosphate sulfate adjuvant), 9.56 mg of sodium chloride, 0.78 mg of L-histidine, 50 mcg of polysorbate 80, 35 mcg of borax, residual traces (<7mcg/dose) of yeast protein and water for injection. The product does not contain a preservative or antibiotics.

PHARMACOLOGY

Mechanism of Action

GARDASIL contains HPV 6, 11, 16 and 18 L1 VLPs. Each VLP is composed of a unique recombinant L1 major capsid protein for the respective HPV type. Because the virus-like particles contain no viral DNA, they cannot infect cells or reproduce.

Pre-clinical data suggests that the efficacy of L1 VLP vaccines is mediated by the development of humoral immune responses. Induction of anti-papillomavirus antibodies with L1 VLP vaccines resulted in protection against infection. Administration of serum from vaccinated to unvaccinated animals resulted in the transfer of protection against HPV to the unvaccinated animals.

The induction of a strong anamnestic (immune memory) response has been further demonstrated in clinical trials (See Clinical Studies, *Immune Memory (Anamnestic Responses)*).

CLINICAL STUDIES

In female subjects, CIN 2/3 and AIS are the immediate precursors of invasive squamous cell carcinoma and invasive adenocarcinoma of the cervix, respectively. Their detection and removal has been shown to prevent invasive cancer (secondary prevention); thus, their primary prevention through vaccination will prevent invasive cancer.

Invasive cervical cancer cannot be used as an endpoint for efficacy studies of HPV vaccines because of the importance of employing secondary prevention measures. Therefore, the immediate precursors, CIN 2 (moderate-grade cervical dysplasia), CIN 3 (high-grade cervical dysplasia including carcinoma *in situ*), and AIS are the most appropriate endpoints for the demonstration of the prevention of cervical cancer by HPV vaccines.

CIN 3 and AIS are classified as Stage 0 cervical cancers according to FIGO (International Federation of Obstetrics and Gynaecology). VIN 2/3 and VaIN 2/3 are the immediate precursors to HPV-related vulvar and vaginal cancer, respectively.

In male subjects, penile/perineal/perianal intraepithelial neoplasia (PIN) 1 (low grade) and PIN 3 (high grade) has been associated with HPV. HPV 16 is the most common type detected. Erythroplasia of Queyrat (EQ), Bowen's disease (BD), and bowenoid papulosis (BP) are clinical presentations of high-grade PIN. BD and EQ have been associated with invasive cancer. BP rarely progresses to malignancy.

The efficacy of GARDASIL or the HPV component of GARDASIL was assessed in 6 placebo-controlled, double-blind, randomized Phase II and III clinical studies. One Phase II study evaluated all four components (i.e., HPV 6, 11, 16, and 18) of GARDASIL (Protocol 007, N = 551 females). An additional phase II study evaluated the HPV 16 component of GARDASIL (Protocol 005, N=2,391 females). Three Phase III studies, termed FUTURE (Females United To Unilaterally Reduce Endo/Ectocervical Disease), evaluated GARDASIL in 5,442 (FUTURE I), 12,157 (FUTURE II), and 3,817 (FUTURE III) females. A fourth Phase III study, Protocol 020, evaluated GARDASIL in 4055 males, including a subset of 598 men (GARDASIL = 299; placebo = 299) who self-identified as having sex with men (MSM population). Together, these studies evaluated 24,358 females 16 through 45 years of age and 4055 males 16 through 26 years of age at enrolment, the majority of whom had been sexually active.

The median duration of follow-up was 4.0, 3.0, 3.0, 3.0, 4.0 and 2.9 years for Protocol 005, Protocol 007, FUTURE I, FUTURE II, FUTURE III, and Protocol 20, respectively, with a maximum follow-up of 5 years. Subjects received vaccine or placebo on the day of enrolment and 2 and 6 months thereafter. Efficacy was analyzed for each study individually and for all studies conducted in females combined.

In the clinical studies, HPV status was not assessed before subjects were enrolled. Thus, subjects who had been exposed to a vaccine HPV type prior to enrolment were included in the studies for evaluation. Overall, 73% of 16 through 26 year old females and 67% of 24 through 45 year old females were naïve to all 4 vaccine HPV types at enrolment. Overall, 83% of 16- through 26-year-old males were naïve to all 4 vaccine HPV types at enrollment. The naïve subjects continued to be at risk for infection and disease caused by all 4 vaccine HPV types. Among the 24 through 45 year old females, only 0.4% had been exposed to all 4 vaccine HPV types. Among the 16- through 26-year-old males, only 0.2% had been exposed to all 4 vaccine HPV types.

Clinical Studies in 16 Through 26 Year Old Females

Prophylactic Efficacy against HPV Types 6, 11, 16 and 18

The primary analyses of efficacy was conducted in the “per-protocol efficacy (PPE) population”, consisting of subjects who received all 3 vaccinations within 1 year of enrolment, did not have major deviations from the study protocol and were naïve to the relevant HPV type(s) prior to dose one and through 1 month Postdose 3 (Month 7). Efficacy was measured starting after the Month 7 visit. (Table 1). In subjects who were naïve (PCR negative and seronegative) to all 4 vaccine HPV types, CIN, genital warts, VIN and VaIN caused by any of the 4 vaccine HPV types were counted as endpoints. Among subjects who were positive (PCR positive and/or seropositive) for a vaccine HPV type at Day 1, endpoints related to that type were not included in the analyses of prophylactic efficacy.

*Evaluated only the HPV 16 L1 VLP vaccine component of GARDASIL

**There were two cases of CIN 3 that occurred in the group that received GARDASIL. In the first case HPV 16 and HPV 52 were detected. This subject was chronically infected with HPV 52 (infection at Day 1, and Months 32.5 and 33.6) in 8 of 11 specimens, including tissue that was excised during LEEP (Loop Electro-Excision Procedure). HPV 16 was found in 1 of 11 specimens at Month 32.5. HPV 16 was not detected in tissue that was excised during LEEP. In the second case HPV 16, HPV 51, and HPV 56 were detected. This subject was infected with HPV 51 (infection detected by PCR at Day 1) in 2 of 9 specimens. HPV 56 was detected (in tissue excised during LEEP) in 3 of 9 specimens at Month 52. HPV 16 was detected in 1 of 9 specimens at a Month 51 biopsy. Given that these cases occurred in the context of mixed infection, with the dominant type being the non-vaccine HPV type, it is likely that the relevant vaccine HPV type was not the causal HPV type. Based on this assessment, it can be inferred that vaccine efficacy against HPV 16/18-related CIN 2/3 or AIS was 100%.

***Analyses of the combined trials were prospectively planned and included the use of similar study entry criteria.

†Among 9 cases of HPV 6, 11, 16 or 18 related CIN (any grade) or AIS detected in the PPE population, 6 cases are likely to be due to non-vaccine HPV types and not to a vaccine HPV type.

n= Number of subjects with at least one follow-up visit after Month 7

CI = Confidence Interval

Note 1: Point estimates and confidence intervals are adjusted for person-time of follow-up.

Note 2: P-values were computed for pre-specified primary hypothesis tests. All p-values were <0.001, supporting the following conclusions: efficacy against HPV 16/18-related CIN 2/3 is >0% (FUTURE II); efficacy against HPV 16/18-related CIN 2/3 is >25% (Combined Protocols); efficacy against HPV 6/11/16/18-related CIN is >20% (FUTURE I); and efficacy against HPV 6/11/16/18-related external genital lesions (EGL) is >20% (FUTURE I).

GARDASIL was equally efficacious against HPV disease caused by each of the four vaccine HPV types.

Table 2
Analysis of Efficacy of GARDASIL in the PPE Population By HPV Type in the Combined Protocols

Population	GARDASIL		Placebo		% Efficacy (95% CI)
	n	Number of cases	n	Number of cases

HPV 11-related	6,932	0	6,856	32	100.0 (88.0, 100.0)

*Protocols 005, 007, 013 (FUTURE I), and 015 (FUTURE II) combined. Analyses of the combined trials were prospectively planned and included the use of similar study entry criteria. Subjects in Protocol 005 do not contribute to the endpoints related to Type 18.

**There were two cases of CIN 3 that occurred in the group that received GARDASIL (FUTURE II). In the first case HPV 16 and HPV 52 were detected. This subject was chronically infected with HPV 52 (infection at Day 1, and Months 32.5 and 33.6) in 8 of 11 specimens, including tissue that was excised during LEEP (Loop Electro-Excision Procedure). HPV 16 was found in 1 of 11 specimens at Month 32.5. HPV 16 was not detected in tissue that was excised during LEEP. In the second case HPV 16, HPV 51, and HPV 56 were detected. This subject was infected with HPV 51 (infection detected by PCR at Day 1) in 2 of 9 specimens. HPV 56 was detected (in tissue excised during LEEP) in 3 of 9 specimens at Month 52. HPV 16 was detected in 1 of 9 specimens at a month 51 biopsy. Given that these cases occurred in the context of mixed infection, with the dominant type being the non-vaccine HPV type, it is likely that the relevant vaccine HPV type was not the causal HPV type. Based on this assessment, it can be inferred that vaccine efficacy against HPV 16/18-related CIN 2/3 or AIS was 100%.

***Protocols 007, 013 (FUTURE I), and 015 (FUTURE II) combined. Analyses of the combined trials were prospectively planned and included the use of similar study entry criteria.

[†]Among 9 cases of HPV 6-, 11-, 16-, or 18-related CIN (any grade) or AIS detected in the PPE population, 6 cases are likely to be due to a non-vaccine HPV type and not to a vaccine HPV type.

n= Number of subjects with at least one follow-up visit after Month 7

CI = Confidence Interval

Note: Point estimates and confidence intervals are adjusted for person-time of follow-up.

Evidence of efficacy was observed during the vaccination period. Among subjects who were naïve to the relevant HPV types prior to vaccination, GARDASIL was 95% efficacious in preventing cases of CIN (any grade) caused by HPV 6, HPV 11, HPV 16, HPV 18, and 97% efficacious in preventing cases of CIN 2 or worse caused by HPV 16 or HPV 18, resulting from infections acquired during the vaccination period (MITT 2 Population).

Prophylactic Efficacy against Cancer Endpoints

In a supplemental analysis, the efficacy of GARDASIL was evaluated against HPV 16/18-related FIGO Stage 0 cervical cancer (CIN 3 and AIS) in the per-protocol efficacy (PPE) population and the modified intention to treat-2 (MITT-2) population. The “MITT-2 population” consisted of subjects who were naïve to the relevant HPV types(s) (types 6, 11, 16, and 18) prior to dose 1, received at least one dose of vaccine or placebo, and had at least one follow-up visit post-Day 30. The MITT-2 population differs from the PPE population in that it includes subjects with major protocol violations and also subjects who became infected with a vaccine HPV type during the vaccination period. Cases were counted starting after Day 30.

GARDASIL was equally efficacious against HPV 16/18-related CIN 3, AIS, VIN 2/3, and VaIN 2/3 in the PPE population (Table 3).

Table 3
Supplemental Analyses of Cancer-Related Endpoints: Efficacy Against HPV 16/18-Related Invasive Cancer Precursors for the Combined Protocols in the PPE* Population of 16 through 26 Year Old Females

Population	GARDASIL		Placebo		% Efficacy (95% CI)
	n	Number of cases	n	Number of cases	
HPV 16- or 18-related CIN 3					
Per-protocol	8,493	2**	8,464	64	96.9 (88.4, 99.6)
HPV 16- or 18-related AIS					
Per-protocol	8,493	0	8,464	7	100.0 (30.6, 100.0)
<p>*The PPE population consisted of individuals who received all 3 vaccinations within 1 year of enrolment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (types 6, 11, 16, and 18) prior to dose 1 and through 1 month Postdose 3 (Month 7).</p> <p>** There were two cases of CIN 3 that occurred in the group that received GARDASIL (FUTURE II). In the first case HPV 16 and HPV 52 were detected. This subject was chronically infected with HPV 52 (infection at Day 1, and Months 32.5 and 33.6) in 8 of 11 specimens, including tissue that was excised during LEEP (Loop Electro-Excision Procedure). HPV 16 was found in 1 of 11 specimens at Month 32.5. HPV 16 was not detected in tissue that was excised during LEEP. In the second case HPV 16, HPV 51, and HPV 56 were detected. This subject was infected with HPV 51 (infection detected by PCR at Day 1) in 2 of 9 specimens. HPV 56 was detected (in tissue excised during LEEP) in 3 of 9 specimens at Month 52. HPV 16 was detected in 1 of 9 specimens at a month 51 biopsy. Given that these cases occurred in the context of mixed infection, with the dominant type being the non-vaccine HPV type, it is likely that the relevant vaccine HPV type was not the causal HPV type. Based on this assessment, it can be inferred that vaccine efficacy against HPV 16/18-related CIN 2/3 or AIS was 100%.</p> <p>n = Number of subjects with at least one follow-up visit after Day 1.</p> <p>CI = Confidence Interval</p> <p>Note: Point estimates and confidence intervals are adjusted for person-time of follow-up.</p>					

Efficacy against HPV 16/18-related disease was 96.7% (95% CI: 90.2%, 99.3%) and 100.0% (95% CI: 60.0%, 100.0%) for CIN 3 and AIS, respectively, in the MITT-2 population.

The supplemental analysis also evaluated efficacy against immediate precursors to vulvar and vaginal cancer (VIN 2/3 or VaIN 2/3). In this analysis the efficacy of GARDASIL against VIN 2/3 or VaIN 2/3 due to HPV 16 and 18 was 100% (95% CI: 78.6%, 100.0%) in the per-protocol population, and 97.0% (95% CI: 82.4%, 99.9%) in the MITT-2 population.

Long-term Prophylactic Efficacy

The efficacy of GARDASIL against HPV 6-, 11-, 16-, or 18-related persistent infection or disease through 60 months was 95.8% (95% CI: 83.8%, 99.5%), with efficacy against disease due to these HPV types being 100% (95% CI: 12.4, 100), a function of sustained immunity.

GARDASIL was equally efficacious against HPV disease caused by HPV types 6, 11, 16, and 18.

Cross Protection Efficacy against HPV Types 31, 33, 45, 52, 56, 58 and 59

The World Health Organization recommends that the evaluation of cross protection focus on the efficacy of the vaccine against CIN (any grade), CIN 2/3, or AIS, demonstrated by the reduction in the incidence of lesions, caused by oncogenic non-vaccine types. Viral persistence (at least 12 months) can also be used to demonstrate cross protection.

The cross-protective efficacy of GARDASIL was evaluated in the combined database of the FUTURE I and FUTURE II trials (N = 17,599). The primary endpoint of this analysis was the combined incidence of HPV 31- and HPV 45-related CIN (grades 1, 2, 3) or AIS. The secondary endpoint of this analysis was the combined incidence of HPV 31-, 33-, 45-, 52-, and 58-related CIN (grades 1, 2, 3) or AIS. Analyses were also conducted to evaluate efficacy with respect to CIN (grades 1, 2, 3) or AIS caused by non-vaccine HPV types individually. In subjects who were naïve to the relevant vaccine HPV types at Day 1 (MITT-2 population, n = 16,895 for the 31/45 composite endpoint and n=16,969 for the 31,33,45,52,58 composite endpoint), a trend towards a reduction in the incidence of HPV 31- and 45-related and HPV 31,33,45,52,58 related CIN (grades 1, 2, 3) or AIS was observed. Administration of GARDASIL reduced the incidence of HPV 31 and HPV 45 related CIN (grades 1, 2, 3) by 37.3% (95% CI: 17.0%, 52.8%) compared with placebo. Administration of GARDASIL reduced the incidence of HPV 31-, 33-, 45-, 52-, and 58-related CIN (grades 1, 2, 3) or AIS by 26.4% (95% CI: 12.9%, 37.8%), compared with placebo. Efficacy was driven by reductions in HPV 31-, 33-, 52-, and 58-related endpoints. There was no clear evidence of efficacy for HPV 45. In a post-hoc analysis, prophylactic administration of GARDASIL also reduced the incidence of HPV 56-related and HPV 59-related CIN (grades 1, 2, 3) or AIS, compared with placebo in this population.

Further post-hoc analyses considered efficacy in a generally HPV-naïve population (negative to 14 common HPV types and had a Pap test that was negative for SIL [Squamous Intraepithelial Lesion] at Day 1), approximating a population of sexually-naïve subjects plus subjects prior to or shortly after sexual debut. When GARDASIL was administered to the generally HPV naïve subjects, there were statistically significant reductions in the incidences of CIN (grades 1,2,3) or AIS caused by HPV 31, 33, 52, and 58 (Table 4). Although there was a trend of reduction in the incidence of CIN (grades 1, 2, 3) or AIS caused by HPV 56 or 59, statistically significant reduction has not been demonstrated.

Table 4
Impact of GARDASIL on the Rates of CIN (any Grade) or AIS for the Combined FUTURE I and FUTURE II Disease Cross Protection Data Set in 16 Through 26 Year old Females

HPV Types	Population	% Reduction	95% CI
HPV 31/45-related**	Generally HPV-naïve* (n = 9,296)	43.6	12.9, 64.1
HPV 31/33/45/52/58-related***	Generally HPV-naïve	29.2	8.3, 45.5
HPV 31/33/52/58-related	Generally HPV-naïve	33.8	13.4, 49.6
HPV 56-related	Generally HPV-naïve	27.6	<0.0, 49.3
HPV 59-related	Generally HPV-naïve	22.3	<0.0, 58.9

*Generally HPV-naïve population included subjects who, at Day 1, had a negative for SIL Pap test and were negative to all of the following HPV types: HPV 6, 11, 16, 18, 31, 33, 35, 39, 45, 51, 52, 56, 58, 59; and had follow-up after Day 30 of the study. Case counting started at Day 30.

**Primary pre-specified endpoint of the analysis.

***Secondary pre-specified endpoint of the analysis.

CI = Confidence Interval

Population Impact

Subjects who were already infected with one or more vaccine-related HPV types prior to vaccination were protected from clinical disease caused by the remaining vaccine HPV types.

Subjects, who had early HPV infection at the time of enrolment and who received GARDASIL did not show a statistically significant reduction of CIN or AIS compared to placebo. Estimated vaccine efficacy was 21.6% (95% CI: < 0.0%, 42.1%). Early infection was defined as infection with a vaccine HPV type at enrolment, but no evidence of immune response to it.

Subjects with evidence of prior infection that had resolved by vaccination onset were protected from reacquisition or recurrence of infection leading to clinical disease.

GARDASIL has not been shown to protect against the diseases caused by every HPV type, and will not treat existing disease. The overall efficacy of GARDASIL in each population will vary with the baseline prevalence of HPV infection and disease, the incidence of infections against which GARDASIL has shown protection, and those infections against which GARDASIL has not been shown to protect.

The benefit of the vaccine with respect to the overall incidence of CIN 2/3 or AIS (caused by any HPV type) became more apparent over time (Figure 1). GARDASIL does not impact the course of infections or disease present at vaccination onset. Over a longer duration of follow-up, the proportion of disease in unvaccinated subjects due to new infection will increase, and the estimated efficacy against disease due to any HPV-type will become more apparent.

Figure 1
Cumulative Incidence of CIN 2/3 or AIS Lesions (Caused by Any HPV Type) Among a Generally HPV-naïve Population of Subjects in the Phase III Clinical Trials (FUTURE I and FUTURE II) in 16 Through 26 Year Old Females

Clinical Studies in 24 Through 45 Year Old Females

Prophylactic Efficacy Analysis in the Per-Protocol Population

A minimum anti-HPV level that provides protection against HPV infection and disease has not been defined. Also, immune responses to vaccines are typically lower in older subjects compared to younger subjects. Therefore, to confirm the utility of GARDASIL to prevent cervical, vulvar, and vaginal cancers and related diseases caused by the types targeted by the vaccine in subjects up to and including age 45 years, an efficacy study (FUTURE III) was conducted.

GARDASIL was highly efficacious in reducing the incidence of persistent infection; CIN (any grade); and external genital lesions (EGL) caused by HPV types 6, 11, 16, and 18. GARDASIL was also highly efficacious in reducing the incidence of a HPV 16/18-related Pap Test diagnosis of ASC-US (Atypical Squamous Cells of Undetermined Significance) positive for high-risk HPV. The primary analyses of efficacy, with respect to HPV types 6, 11, 16, and 18, were conducted in the per-protocol efficacy (PPE) population. Efficacy was measured starting after the Month 7 visit (Table 5).

On the basis of these efficacy findings, the efficacy of GARDASIL with respect to prevention of cervical, vulvar, and vaginal cancers and related diseases in subjects up to and including age 45 years can be inferred.

Table 5
Analysis of Efficacy of GARDASIL in the PPE Population of 24- Through 45-Year-Old Females

Endpoint	GARDASIL		Placebo		% Efficacy (95% CI)
	n	Number of cases	n	Number of cases	
HPV 6-, 11-, 16-, or 18-related CIN (any grade), Persistent Infection, or EGL	1,601	10*	1,599	86	88.7 (78.1, 94.8)
HPV 16- or 18-related CIN (any grade), Persistent Infection, or EGL	1,587	8*	1,571	51	84.7 (67.5, 93.7)
HPV 6- or 11-related CIN (any grade), Persistent Infection, or EGL	1,316	2	1,316	38	94.8 (79.9, 99.4)
HPV 16/18-related Pap Diagnosis of ASC-US Positive for High-risk HPV	1,565	1	1,557	27	96.3 (77.7, 99.9)

*There was 1 case of CIN 2 in the PPE group. The CIN 2 case was positive for HPV types 16 and 51 at a Month 18 biopsy. The remaining 9 cases in the PPE group were persistent infection endpoints.

CI = Confidence interval

ASC-US = Atypical Squamous Cells of Undetermined Significance

Clinical Studies in 16 Through 26 Year Old Males

Prophylactic Efficacy Analysis in the Per-Protocol Population

In clinical studies in males, efficacy was evaluated using the following endpoints: external genital warts; penile/perineal/perianal intraepithelial neoplasia (PIN) grades 1/2/3 or penile/perineal/perianal cancer; and persistent infection. High grade PIN is associated with certain types of penile/perineal/perianal cancers. Persistent infection is a predictor of clinical disease.

The primary analyses of efficacy were conducted in the per-protocol efficacy (PPE) population. This population consisted of subjects who received all 3 vaccinations within 1 year of enrollment, did not have major deviations from the study protocol, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (Types 6, 11, 16, and 18) prior to dose 1 and through 1 month postdose 3 (month 7). Efficacy was measured starting after the Month 7 visit.

GARDASIL was efficacious in reducing the incidence of external genital lesions (Condyloma and PIN grades 1/2/3) and persistent infection related to vaccine HPV types 6, 11, 16, or 18 in those who were PCR negative and seronegative at baseline (Table 6).

Table 6
Analysis of Efficacy of GARDASIL in the PPE Population of 16- Through 26-Year-Old Males for Vaccine HPV Types

Endpoint	GARDASIL (N = 2025)		AAHS Control (N = 2030)		% Efficacy (95% CI*)
	N	Number of cases	N	Number of cases

HPV 18 -related	1327	2	1350	33	93.9 (76.3, 99.3)

*A 97.5% CI is reported for the HPV 6/11/16/18-related persistent infection endpoint due to the multiplicity adjustment applied.

**persistent infection detected in samples from two or more consecutive visits 6 months apart (± 1 month) or longer

N = Number of individuals with at least 1 follow-up visit after Month 7

CI = Confidence Interval

AAHS Control = Amorphous Aluminium Hydroxyphosphate Sulfate

Prophylactic Efficacy – Anal Disease Caused by HPV Types 6, 11, 16, and 18 in Boys and Men 16 Through 26 Years of Age in the MSM Sub-study

A sub-study of Protocol 020 evaluated the efficacy of GARDASIL against anal disease (anal intraepithelial neoplasia and anal cancer) in a population of 598 MSM. In this sub-study, cases of AIN 2/3 were the efficacy endpoints used to assess prevention of HPV-related anal cancer. The primary analyses of efficacy were conducted in the per-protocol efficacy (PPE) population of Protocol 020.

GARDASIL was efficacious in reducing the incidence of anal intraepithelial neoplasia (AIN) grades 1 (both condyloma and non-acuminate), 2, and 3 related to vaccine HPV types 6, 11, 16, and 18 in those boys and men who were PCR negative and seronegative at baseline (Table 7).

Table 7
Analysis of Efficacy of GARDASIL for Anal Disease in the PPE Population of 16- Through 26-Year-Old Boys and Men in the MSM Sub-study for Vaccine HPV Types

HPV 6, 11, 16, or 18-related Endpoint	GARDASIL (N = 299)		AAHS Control (N = 299)		% Efficacy (95% CI)
	N	Number of cases	N	Number of cases

AIN 2/3	194	3	208	13	74.9 (8.8, 95.4)
AIN 1	194	4	208	16	73.0 (16.3, 93.4)

N = Number of individuals with at least 1 follow-up visit after Month 7

CI = Confidence Interval

AAHS Control = Amorphous Aluminium hydroxyphosphate sulfate

Immunogenicity

The immunogenicity of GARDASIL was assessed in 23,951 9- through 45- year old females (GARDASIL N = 12,634; placebo N = 11,317) and 5,417 males aged 9 through 26 years (GARDASIL N=3,109; placebo N=2,308). Because of the very high efficacy of GARDASIL in clinical trials, it has not been possible to establish minimum anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 antibody levels that protect against clinical HPV disease.

Type-specific assays with type-specific standards were used to assess immunogenicity to each vaccine HPV type. These assays measured antibodies against neutralizing epitopes for each HPV type, rather than the total antibodies directed at the VLPs in the vaccine. The scales for these assays are unique to each HPV type; thus, comparisons across types and to other assays are not meaningful. The assays used to measure the immune responses to GARDASIL were demonstrated to correlate with the capacity to neutralize live HPV virions.

There was no interference in the immune response to vaccine HPV types induced by GARDASIL. Seropositivity at Day 1 for one vaccine HPV type did not have a negative impact on Postdose 3 anti-HPV responses to other vaccine HPV types.

The primary immunogenicity analyses were conducted in a per-protocol immunogenicity (PPI) population. This population consisted of subjects who were seronegative and Polymerase Chain Reaction (PCR) negative to the relevant HPV type(s) at enrolment, remained HPV PCR negative to the relevant HPV type(s) through 1 month Postdose 3 (Month 7), received all 3 vaccinations, and did not deviate from the study protocol in ways that could interfere with the effects of the vaccine.

Immune Response to GARDASIL at Month 7 in 9 Through 45-Year-Old Females (Time Point Approximating Peak Immunogenicity)

In the per-protocol immunogenicity population of 9- through 45-year-olds, seropositivity at Month 7 ranged from 96.4% to 99.9% across all 4 vaccine types and across populations defined by age range. Anti-HPV GMTs for all types decreased with age (Table 8). This finding is expected, as the immune responses to vaccines generally decrease was observed age-related decrease in anti-HPV GMTs.

Table 8
Summary of Percent Seroconversion and Anti-HPV cLIA GMTs at Month 7 in the PPI* Population of 9- Through 45-Year-Old Girls and Women

Population	N**	n***	% Seropositive (95% CI)	GMT (95% CI) mMU/mL [†]
Anti-HPV 6				
9- through 15-year-old girls	1,122	917	99.9 (99.4, 100.0)	929.2 (874.6, 987.3)
16- through 26-year-old girls and women	9,859	3,329	99.8 (99.6, 99.9)	545.0 (530.1, 560.4)
27- through 34-year-old women	667	439	98.4 (96.7, 99.4)	435.6 (393.4, 482.4)
35- through 45-year-old women	957	644	98.1 (96.8, 99.0)	397.3 (365.2, 432.2)
Anti-HPV 11				
9- through 15-year-old girls	1,122	917	99.9 (99.4, 100.0)	1,304.6 (1,224.7, 1,389.7)
16- through 26-year-old girls and women	9,859	3,353	99.8 (99.5, 99.9)	748.9 (726.0, 772.6)
27- through 34-year-old women	667	439	98.2 (96.4, 99.2)	577.9 (523.8, 637.5)
35- through 45-year-old women	957	644	97.7 (96.2, 98.7)	512.8 (472.9, 556.1)

9- through 15-year-old girls	1,122	915	99.9 (99.4, 100.0)	4,918.5 (4,556.6, 5,309.1)
16- through 26-year-old girls and women	9,859	3,249	99.8 (99.6, 100.0)	2,409.2 (2,309.0, 2,513.8)
27- through 34-year-old women	667	435	99.3 (98.0, 99.9)	2,342.5 (2,119.1, 2,589.6)
35- through 45-year-old women	957	657	98.2 (96.8, 99.1)	2,129.5 (1,962.7, 2,310.5)
Anti-HPV 18				
9- through 15-year-old girls	1,122	922	99.8 (99.2, 100.0)	1,042.6 (967.6, 1,123.3)
16- through 26-year-old girls and women	9,859	3,566	99.4 (99.1, 99.7)	475.2 (458.8, 492.1)
27- through 34-year-old women	667	501	98.0 (96.4, 99.0)	385.8 (347.6, 428.1)
35- through 45-year-old women	957	722	96.4 (94.8, 97.6)	324.6 (297.6, 354.0)

*The PPI population consisted of individuals who received all 3 vaccinations within pre-defined day ranges, did not have major deviations from the study protocol, met predefined criteria for the interval between the Month 6 and Month 7 visit, and were naïve (PCR negative and seronegative) to the relevant HPV type(s) (types 6, 11, 16, and 18) prior to dose 1 and through 1 month Postdose 3 (Month 7).

**Number of individuals randomized to the respective vaccination group who received at least 1 injection

***Number of individuals contributing to the analysis

[†]mMU = milli-Merck units

CI = Confidence Interval

Immune Response to GARDASIL at Month 7 in 9 Through 26-Year-Old Males (Time Point Approximating Peak Immunogenicity)

In the per-protocol immunogenicity population of 9- through 26-year-olds, seropositivity at Month 7 ranged from 97.4% to 99.9% across all 4 vaccine types and across populations defined by age range. Anti-HPV GMTs for all types decreased with age (Table 9). This finding is expected, as the immune responses to vaccines generally decrease with age at vaccination. The efficacy of GARDASIL remained high despite the observed age-related decrease in anti-HPV GMTs.

Table 9
Summary of Percent Seroconversion and Anti-HPV cLIA GMTs at Month 7 in the PPI* Population of 9- Through 26-Year-Old Boys and Men

CI = Confidence Interval

Bridging the Efficacy of GARDASIL from Adults to Adolescents

A clinical study compared anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 responses in 10 through 15 year old females with responses in 16 through 23 year old females. Among females who received GARDASIL, 99.1 to 100% became anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 seropositive by 1 month Postdose 3. Anti-HPV responses in 10 through 15 year old females were significantly superior to those observed in 16 to 23 year old females.

Similar outcomes were observed in a comparison of the anti-HPV responses 1 month Postdose 3 among 9 through 15 year old females with anti-HPV responses in 16 through 26 year old females in the combined database of immunogenicity studies for GARDASIL.

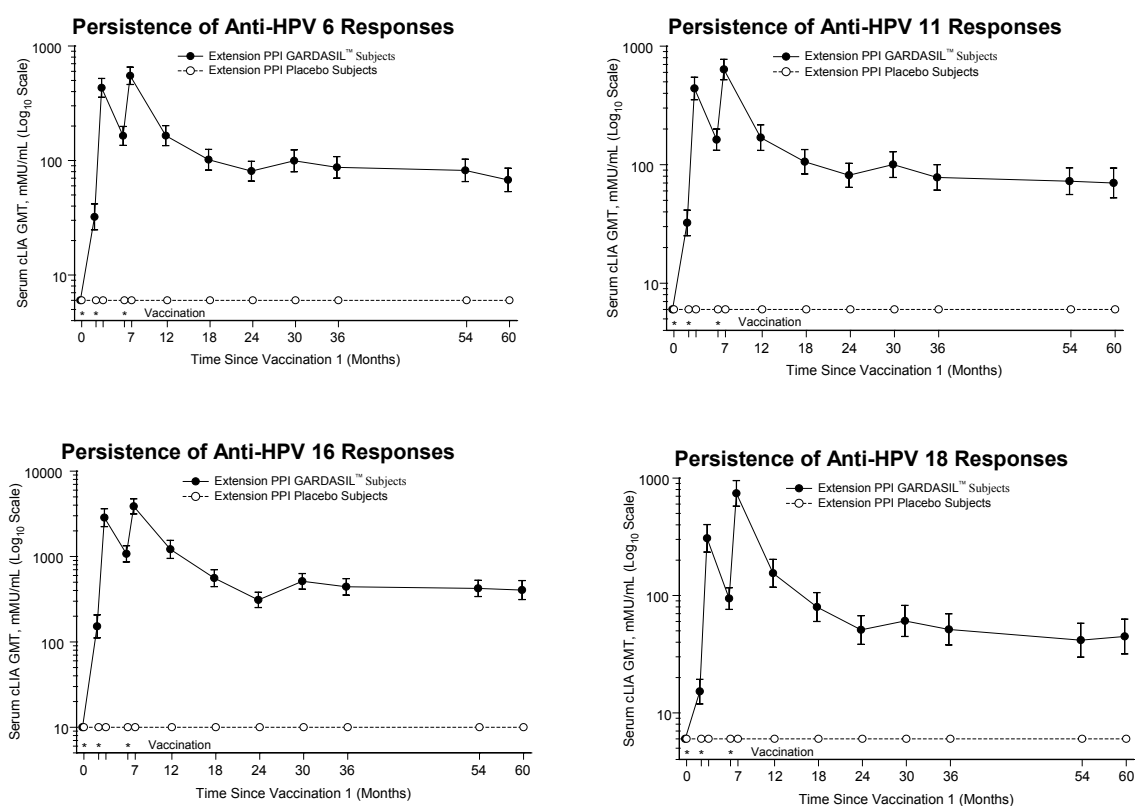

Anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 responses (GMTs) were compared between 9- through 15-year-old males and 16- through 26-year-old males. Among males who received GARDASIL, 97.4% to 99.9% became anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 seropositive by 1 month postdose 3. Anti-HPV responses in 9- through 15-year-old males were significantly superior to those observed in 16- through 26-year-old males.

On the basis of this immunogenicity bridging, the efficacy of GARDASIL in 9 through 15 year old females is comparable to the efficacy of GARDASIL observed in 16 through 26 year old females. Additionally, the efficacy of GARDASIL in 9- through 15-year-old males is comparable to the efficacy of GARDASIL observed in studies in 16- through 26-year-old males.

Persistence of Immune Response of GARDASIL

In Protocol 007, peak anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 GMTs were observed at Month 7. The GMTs decreased through Month 24 and then stabilized until at least Month 60 (see Figure 2).

Figure 2
Persistence of Anti-HPV Responses Following a 3-dose Regimen of GARDASIL

Immune Memory (Anamnestic) Responses

GARDASIL boosts immunologically primed subjects (i.e., subjects with evidence of a previous natural infection). For each HPV type, anti-HPV GMTs measured 1 month Postdose 3 were approximately 1.4- to 2.4-fold higher in subjects with detectable antibodies for that type at Day 1 compared with subjects who were seronegative for that type at Day 1.

To simulate the potential impact of natural exposure, a study to evaluate immune memory was conducted. Subjects who received a 3-dose primary series of vaccine were given a challenge dose of GARDASIL 5 years after the onset of vaccination.

These subjects exhibited a rapid and strong anamnestic response that exceeded the anti-HPV GMTs observed 1 month Postdose 3 (Month 7) (Table 10).

Table 10
Comparison of HPV Antibody Responses At Month 7, Month 60, 1 Week Post-Challenge Dose, and 1 Month Post-Challenge Dose for GARDASIL in The Extension Per-Protocol Population*

Challenge Dose for GARDASIL in The Extension Per-Protocol Population					
Time Postdose	n	GMT (mMU/mL)	95% Confidence Interval	Fold Change from Month 7	Fold Change Pre-challenge vs. Post-challenge
HPV 6					
Month 7	80	549.2	(460.6, 654.7)	-	10.2
Month 60 (Pre-challenge)	79	67.7	(53.5, 85.7)	-	
Month 60 + 1 Week Post-challenge	79	503.3	(344.2, 736.1)	0.9	
Month 61 (Post-challenge)	80	693.2	(451.9, 1063.3)	1.3	
HPV 11					
Month 7	80	635.5	(521.3, 774.9)	-	37.8
Month 60 (Pre-challenge)	79	70.1	(52.5, 93.7)	-	
Month 60 + 1 Week Post-challenge	79	1417.5	(1009.0, 1991.4)	2.2	
Month 61 (Post-challenge)	80	2652.4	(1956.7, 3595.3)	4.2	
HPV 16					
Month 7	82	3870.0	(3157.0, 4744.0)	-	14.1
Month 60 (Pre-challenge)	82	404.2	(312.9, 522.1)	-	
Month 60 + 1 Week Post-challenge	81	4466.4	(3095.2, 6445.0)	1.2	
Month 61 (Post-challenge)	81	5714.0	(3829.7, 8525.4)	1.5	
HPV 18					
Month 7	86	741.2	(576.8, 952.4)	-	27.5
Month 60 (Pre-challenge)	85	44.7	(31.8, 62.8)	-	
Month 60 + 1 Week Post-challenge	84	1033.2	(753.9, 1415.8)	1.4	
Month 61 (Post-challenge)	86	1230.0	(904.5, 1672.5)	1.7	
*The extension per-protocol population includes all extension subjects who received 3 primary injections of GARDASIL and antigen challenge of GARDASIL at month 60, were seronegative and Polymerase Chain Reaction (PCR) negative at Day 1 to the respective vaccine HPV types, PCR negative through Month 60 to the respective vaccine HPV types, and had valid serology data 4 weeks post-challenge. Note: GMT = Geometric mean titer in mMU/mL (mMU = milli-Merck units).					

Schedule flexibility

All subjects evaluated in the PPE populations of the Phase II and III studies received the 3-dose regimen of GARDASIL within a 1-year period, regardless of the interval between doses. An analysis of immune response data suggests that flexibility of ± 1 month for Dose 2 (i.e., Month 1 to Month 3 in the vaccination regimen) and flexibility of ± 2 months for Dose 3 (i.e., Month 4 to Month 8 in the vaccination regimen) do not substantially impact the immune responses to GARDASIL (see DOSAGE AND ADMINISTRATION).

Studies with Other Vaccines

The safety and immunogenicity of co-administration of GARDASIL with hepatitis B vaccine (recombinant) (same visit, injections at separate sites) were evaluated in a randomized study of 1,871 females 16 through 24 years of age at enrolment. Immune response and safety profile to both hepatitis B vaccine (recombinant) and GARDASIL were similar whether they were administered at the same visit or at a different visit.

INDICATIONS

GARDASIL is indicated in females aged 9 through 45 years* for the prevention of cervical, vulvar, vaginal and anal cancer, precancerous or dysplastic lesions, genital warts, and infection caused by Human Papillomavirus (HPV) Types 6, 11, 16, and 18 (which are included in the vaccine).

GARDASIL is indicated in males 9 through 26 years of age for the prevention of anal cancer, precancerous or dysplastic lesions, external genital lesions and infection caused by HPV types 6, 11, 16, and 18 (which are included in the vaccine).

*Immunogenicity studies have been conducted to link efficacy in females and males aged 16 to 26 years to the younger populations.

CONTRAINDICATIONS

Hypersensitivity to the active substances or to any of the excipients of the vaccine (see DESCRIPTION).

Individuals who develop symptoms indicative of hypersensitivity after receiving a dose of GARDASIL should not receive further doses of GARDASIL.

PRECAUTIONS

General

As for any vaccine, vaccination with GARDASIL may not result in protection in all vaccine recipients.

This vaccine is not intended to be used for treatment of active external genital lesions; cervical, vulvar, vaginal or anal cancers; CIN, VIN, VaIN, or AIN related to HPV vaccine types or non-vaccine serotypes.

This vaccine will not protect against diseases that are not caused by HPV. Oncogenic HPV types other than HPV 16 and 18 may cause cervical cancer. Vaccination may therefore not prevent HPV infection and disease due to these other oncogenic types (see Clinical Studies). Routine cervical screening and detection and removal of cervical lesions should be continued in individuals who receive the vaccine.

Syncope (fainting) may follow any vaccination, especially in adolescents and young adults. Syncope, sometimes associated with falling, has occurred after vaccination with GARDASIL. Therefore, vaccinees should be carefully observed for approximately 15 minutes after administration of GARDASIL (see ADVERSE REACTIONS, Post Marketing Reports).

As with all injectable vaccines, appropriate medical treatment should always be readily available in case of rare anaphylactic reactions following the administration of the vaccine.

The decision to administer or delay vaccination because of a current or recent febrile illness depends largely on the severity of the symptoms and their etiology. Low-grade fever itself and mild upper respiratory infection are not generally contraindications to vaccination.

Individuals with impaired immune responsiveness, whether due to the use of immunosuppressive therapy, a genetic defect, Human Immunodeficiency Virus (HIV) infection, or other causes, may have reduced antibody response to active immunization (see DRUG INTERACTIONS).

This vaccine should be given with caution to individuals with thrombocytopenia or any coagulation disorder because bleeding may occur following an intramuscular administration in these individuals.

Carcinogenicity

GARDASIL has not been evaluated for carcinogenic potential.

Genotoxicity

GARDASIL has not been evaluated for genotoxic potential.

Effects on Fertility

Female rats were given the clinical dose of GARDASIL (500mcL) intramuscularly twice (during early gestation and one week postnatal) or four times (five and two weeks prior to mating, during early gestation, and one week postnatal). Mating performance and fertility of the dams or their offspring were not affected.

GARDASIL administered to male rats at a dose of 120 mcg total protein, which corresponds to approximately 200-fold excess relative to the projected human dose, had no effects on reproductive performance including fertility, sperm count, and sperm motility, and there were no vaccine-related gross or histomorphologic changes on the testes and no effects on testes weights.

Use in Pregnancy (Category B2)

Studies in Female Rats

Female rats were given the clinical dose of GARDASIL (500mcL) intramuscularly twice (during early gestation and one week postnatal) or four times (five and two weeks prior to mating, during early gestation, and one week postnatal). Maternal toxicity or adverse effects on offspring were not observed. High titers of HPV-type specific antibodies were detected in maternal blood during gestation, in near-term foetal blood, and in blood of offspring at weaning and at 11 weeks postnatal, indicative of transplacental and lactational transfer of antibodies (see Use in Lactation). The effect of GARDASIL administration of vaccine-treated males on offspring has not been studied.

Clinical Studies in Humans

GARDASIL is not recommended for use in pregnant women.

In clinical studies, women underwent urine pregnancy testing prior to administration of each dose of GARDASIL. Women who were found to be pregnant before completion of a 3-dose regimen of GARDASIL were instructed to defer completion of their vaccination regimen until resolution of the pregnancy. Such non-standard regimens resulted in Postdose 3 anti-HPV 6, anti-HPV 11, anti-HPV 16, and anti-HPV 18 responses that were comparable to those observed in women who received a standard 0, 2, and 6 month vaccination regimen (see DOSAGE AND ADMINISTRATION).

During clinical trials, 3,819 women (vaccine N = 1,894 vs. placebo N = 1,925) reported at least one pregnancy. The overall proportions of pregnancies that resulted in an adverse outcome defined as the combined numbers of spontaneous abortion, late foetal death, congenital anomaly cases out of the total number of pregnancy outcomes for which an outcome was known (and excluding elective terminations), were 22.6% (446/1,973) in subjects who received GARDASIL and 23.1% (460/1994) in subjects who received placebo.

Further sub-analyses were done to evaluate pregnancies with estimated onset within 30 days or more than 30 days from administration of a dose of GARDASIL or placebo. For pregnancies with estimated onset within 30 days of vaccination, 5 cases of congenital anomaly were observed in the group that received GARDASIL compared to 1 case of congenital anomaly in the group that received placebo. Conversely, in pregnancies with onset more than 30 days following vaccination, 40 cases of congenital anomaly were observed in the group that received GARDASIL compared with 33 cases of congenital anomaly in the group that received placebo. The types of anomalies observed were consistent (regardless of when pregnancy occurred in relation to vaccination) with those generally observed in pregnancies in women 16 through 45 years of age.

Thus, there is no evidence to suggest that administration of GARDASIL adversely affects fertility, pregnancy, or infant outcomes.

Use in Lactation

Studies in Female Rats

Female rats were given the clinical dose of GARDASIL (500mcL) intramuscularly twice (during early gestation and one week postnatal) or four times (five and two weeks prior to mating, during early gestation, and one week postnatal). Maternal toxicity or adverse effects on offspring were not observed. Offspring of dams receiving the two doses had higher serum titres of HPV-type specific antibodies at weaning than near term fetuses, suggesting transfer of antibodies in milk as well as via the placenta (see Use in Pregnancy). Antibodies were still present in offspring at postnatal week 11 when they were last measured.

Clinical Studies in Humans

It is not known whether vaccine antigens or antibodies induced by the vaccine are excreted in human milk.

GARDASIL may be administered to lactating women.

GARDASIL or placebo were given to a total of 1,133 women who were breast feeding at any time during the relevant Phase III clinical studies. In these studies, the rates of adverse experiences in the mother and the nursing infant were comparable between vaccination groups. In addition, vaccine immunogenicity was comparable among nursing mothers and women who did not nurse during the vaccine administration.

Paediatric Use

The safety and efficacy of GARDASIL have not been evaluated in children younger than 9 years.

Use in the Elderly

The safety and efficacy of GARDASIL have not been evaluated in the elderly population.

Use in other special populations

The safety, immunogenicity, and efficacy of GARDASIL have not been evaluated in HIV-infected individuals.

Drug Interactions

Use with Other Vaccines

Results from clinical studies indicate that GARDASIL may be administered concomitantly (at a separate injection site) with hepatitis B vaccine (recombinant). GARDASIL has not been studied in clinical trials with other vaccines.

Use with Common Medications

In clinical studies in females aged 16 to 26 years, 11.9%, 9.5%, 6.9%, and 4.3% of individuals used analgesics, anti-inflammatory drugs, antibiotics, and vitamin preparations respectively. In a clinical study in females aged 24 to 45 years, 30.6%, 20.2%, 11.6%, and 7.5% of individuals used analgesics, anti-inflammatory drugs, antibiotics, and vitamin preparations, respectively. In a clinical study in males aged 16 to 26 years, 10.3%, 7.8%, 6.8%, 3.4% and 2.6% of individuals used analgesics, anti-inflammatory drugs, antibiotics, antihistamines, and vitamin preparations, respectively. The efficacy, immunogenicity, and safety of the vaccine were not impacted by the use of these medications.

Use with Hormonal Contraceptives

In clinical studies 50.2% of females (16 to 45 years of age), who received GARDASIL, used hormonal contraceptives. Use of hormonal contraceptives did not appear to affect the immune responses to GARDASIL.

Use with Steroids

In clinical studies in females aged 16 to 26 years, 1.7% (n = 158), 0.6% (n = 56), and 1.0% (n = 89) of individuals used inhaled, topical, and parenteral immunosuppressants, respectively. In a clinical study in females aged 24 to 45 years, 1.4% (n = 27) used corticosteroids for systemic use. In a clinical study in males aged 16 to 26 years, 1.0% (n = 21) used corticosteroids for systemic use. The corticosteroids for all subjects were administered close to the time of administration of a dose of GARDASIL. These medicines did not appear to affect the immune responses to GARDASIL. Very few subjects in the clinical studies were taking steroids and the amount of immunosuppression is presumed to have been low.

Use with Systemic Immunosuppressive Medications

There are no data on the concomitant use of potent immunosuppressants with GARDASIL. Individuals receiving therapy with immunosuppressive agents (systemic doses of corticosteroids, antimetabolites, alkylating agents, cytotoxic agents) may not respond optimally to active immunization (see PRECAUTIONS, General).

ADVERSE REACTIONS

In 7 clinical trials (6 placebo-controlled), subjects were administered GARDASIL or placebo on the day of enrolment, and approximately 2 and 6 months thereafter. GARDASIL demonstrated a favorable safety profile when compared with placebo (aluminium or non-aluminium containing). Few subjects (0.2%) discontinued due to adverse experiences. In all except one of the clinical trials, safety was evaluated using vaccination report card (VRC)-aided surveillance for 14 days after each injection of GARDASIL or placebo. The subjects who were monitored using VRC-aided surveillance included 10,088 subjects (6,995 females 9 through 45 years of age, 3,093 males 9 through 26 years of age at enrolment) who received GARDASIL and 7,995 subjects who received placebo.

The vaccine-related adverse experiences that were observed among recipients of GARDASIL at a frequency of at least 1.0% and also at a greater frequency than that observed among placebo recipients are shown in Tables 11 and 12.

Table 11
Vaccine-related Injection-site and Systemic Adverse Experiences: 9- Through 45-Year-Old Females*

Adverse Experience (1 to 5 Days Postvaccination)	GARDASIL (N = 6,995), %	AAHS** Adjuvant – containing Placebo (N = 5,372), %	Saline Placebo (N = 320), %
Injection Site			
Pain	81.5	70.6	48.6
Swelling	23.5	14.2	7.3
Erythema	21.9	15.6	12.1
Pruritus	2.7	2.3	0.6
Bruising	2.2	2.8	1.6
Adverse Experience (1 to 15 Days Postvaccination)	GARDASIL (N = 6,995), %	Placebo (N = 5,692), %	
Systemic			
Headache	20.5	20.3	
Fever	10.1	8.7	
Nausea	3.7	3.4	
Dizziness	2.9	2.7	
Pain in extremity	1.5	1.0	

*The vaccine-related adverse experiences that were observed among recipients of GARDASIL at a frequency of at least 1.0% and also at a greater frequency than that observed among placebo recipients.

** amorphous aluminium hydroxyphosphate sulfate

Of those females who reported an injection site reaction, 94.2% judged their injection-site adverse experience to be mild or moderate in intensity.

In addition, bronchospasm was reported very rarely as a serious adverse experience.

Table 12
Vaccine-Related Injection-Site and Systemic Adverse Experiences: 9- Through 26-Year-Old Males*

Adverse Experience (1 to 5 Days Postvaccination)	GARDASIL (N = 3,093), %	AAHS** Adjuvant- containing Placebo (N = 2,029), %	Saline Placebo (N = 274), %
<i>Injection Site</i>			
Pain	61.5	50.8	41.6
Erythema	16.7	14.1	14.5
Swelling	13.9	9.6	8.2
Haematoma	1.0	0.3	3.3
Adverse Experience (1 to 15 Days Postvaccination)	GARDASIL (N = 3,093), %	Placebo (N = 2,303), %	
<i>Systemic</i>			
Headache	7.5	6.7	
Fever	6.3	5.1	

*The vaccine-related adverse experiences that were observed among recipients of GARDASIL at a frequency of at least 1.0% and also at a greater frequency than that observed among placebo recipients.

**amorphous aluminium hydroxyphosphate sulfate

Of those males who reported an injection site reaction, 96.4% judged their injection-site adverse reaction to be mild or moderate in intensity.

All-cause Common Systemic Adverse Experiences

All-cause systemic adverse experiences for subjects that were observed at a frequency of greater than or equal to 1% where the incidence in the vaccine group was greater than or equal to the incidence in the placebo group are shown in Table 13 and 14.

Table 13
All-cause Common Systemic Adverse Experiences in Females

Adverse Experience (1 to 15 Days Postvaccination)	GARDASIL (n = 6995) %	Placebo* (n = 5692) %
Headache	28.1	28.1
Pyrexia	12.7	11.6
Nausea	5.9	5.5
Nasopharyngitis	5.8	5.8
Dizziness	4.0	3.9
Diarrhoea	3.4	3.3
Pain in extremity	2.7	2.4
Abdominal Pain, upper	2.6	2.5
Vomiting	2.0	1.7
Myalgia	1.8	1.6
Cough	1.7	1.5
Upper respiratory tract infection	1.6	1.5
Toothache	1.5	1.4
Malaise	1.3	1.3
Arthralgia	1.1	0.9
Migraine	1.0	1.0

*Aluminium and/or non-aluminium containing placebo

Table 14
All-cause Common Systemic Adverse Experiences in Males

Adverse Experience (1 to 15 Days Postvaccination)	GARDASIL (n = 3093) %	Placebo* (n = 2303) %
Headache	12.3	11.2
Pyrexia	8.3	6.5
Oropharyngeal pain	2.8	2.1
Diarrhoea	2.7	2.2
Nasopharyngitis	2.6	2.6
Nausea	2.0	1.0
Upper respiratory tract infection	1.5	1.0
Abdominal pain upper	1.4	1.4
Myalgia	1.3	0.7
Dizziness	1.2	0.9
Vomiting	1.0	0.8

*Aluminium and/or non-aluminium containing placebo

The safety of GARDASIL when administered concomitantly with hepatitis B vaccine (recombinant) was evaluated in a placebo-controlled study. The frequency of adverse experiences observed with concomitant administration was similar to the frequency when GARDASIL was administered alone.

Post-marketing Reports

The following adverse experiences have been spontaneously reported during post-approval use of GARDASIL. Because these experiences were reported voluntarily from a population of uncertain size, it is not possible to reliably estimate their frequency or to establish a causal relationship to vaccine exposure.

Infections and infestations: cellulitis

Blood and lymphatic system disorders: idiopathic thrombocytopenic purpura, lymphadenopathy

Nervous system disorders: acute disseminated encephalomyelitis, dizziness, Guillain-Barré syndrome, headache, syncope sometimes accompanied by tonic-clonic movements.

Gastrointestinal disorders: nausea, vomiting.

Musculoskeletal and connective tissue disorders: arthralgia, myalgia

General disorders and administration site conditions: asthenia, chills, fatigue, malaise.

Immune system disorders: Hypersensitivity reactions including anaphylactic/anaphylactoid reactions, bronchospasm, and urticaria.

DOSAGE AND ADMINISTRATION

Dosage

GARDASIL should be administered intramuscularly as 3 separate 0.5-mL doses according to the following schedule:

First dose: at elected date

Second dose: 2 months after the first dose

Third dose: 6 months after the first dose

Individuals are encouraged to adhere to the 0, 2, and 6 months vaccination schedule. However, in clinical studies, efficacy has been demonstrated in individuals who have received all 3 doses within a 1-year period. If an alternate vaccination schedule is necessary, the second dose should be administered at least 1 month after the first dose and the third dose should be administered at least 3 months after the second dose. (see CLINICAL STUDIES, Schedule Flexibility).

Method of Administration

GARDASIL should be administered intramuscularly in the deltoid region of the upper arm or in the higher anterolateral area of the thigh.

Syncope (fainting) may follow any vaccination, especially in adolescents and young adults. Syncope, sometimes associated with falling, has occurred after vaccination with GARDASIL. Therefore, vaccinees should be carefully observed for approximately 15 minutes after administration of GARDASIL.

GARDASIL must not be injected intravascularly. Neither subcutaneous nor intradermal administration has been studied. These methods of administration are not recommended.

The prefilled syringe is for single use only and should not be used for more than one individual. The vials are for single use in one patient only. For single-use vials a separate sterile syringe and needle must be used for each individual.

The vaccine should be used as supplied; no dilution or reconstitution is necessary. The full recommended dose of the vaccine should be used.

Shake well before use. Thorough agitation immediately before administration is necessary to maintain suspension of the vaccine.

After thorough agitation, GARDASIL is a white, cloudy liquid. Parenteral drug products should be inspected visually for particulate matter and discolouration prior to administration. Discard the product if particulates are present or if it appears discoloured.

Prefilled Syringe Use

Inject the entire contents of the syringe.

Single-dose Vial Use

Withdraw the 0.5-mL dose of vaccine from the single-dose vial using a sterile needle and syringe free of preservatives, antiseptics, and detergents. Once the single-dose vial has been penetrated, the withdrawn vaccine should be used promptly, and the vial must be discarded.

NOTE: When choosing a needle, it should fit securely on the syringe.

PRESENTATION & STORAGE CONDITIONS

Presentation

GARDASIL is a sterile cloudy white liquid.

Storage

Store refrigerated at 2 to 8°C (36 to 46°F). Do not freeze. Protect from light.

GARDASIL should be administered as soon as possible after being removed from refrigeration. GARDASIL can be out of refrigeration at temperatures, at or below 25°C, for a total time of not more than 72 hours.

OVERDOSAGE

There have been reports of administration of higher than recommended doses of GARDASIL.

In general, the adverse event profile reported with overdose was comparable to recommended single doses of GARDASIL.
